

Wiki Processors

Processors are [WikiMacros](#) designed to provide alternative markup formats for the [Wiki engine](#). Processors can be thought of as *macro functions to process user-edited text*.

Wiki processors can be used in any Wiki text throughout Trac, for various different purposes, like:

- [syntax highlighting](#) or for rendering text verbatim,
- rendering [Wiki markup inside a context](#), like inside `<div>` blocks or `` or within `<td>` or `<th>` table cells,
- using an alternative markup syntax, like [raw HTML](#) and [Restructured Text](#), or [?textile](#)

Using Processors

To use a processor on a block of text, first delimit the lines using a [Wiki code block](#):

```
{ {{
The lines
that should be processed...
}}}
```

Immediately after the `{ {{` or on the line just below, add `#!` followed by the *processor name*.

```
{ {{
#!processorname
The lines
that should be processed...
}}}
```

This is the "shebang" notation, familiar to most UNIX users.

Besides their content, some Wiki processors can also accept *parameters*, which are then given as `key=value` pairs after the processor name, on the same line. If `value` has to contain space, as it's often the case for the `style` parameter, a quoted string can be used (`key="value with space"`).

As some processors are meant to process Wiki markup, it's quite possible to *nest* processor blocks. You may want to indent the content of nested blocks for increased clarity, this extra indentation will be ignored when processing the content.

Examples

Wiki Markup	Display
Example 1: Inserting raw HTML	
<pre>{ {{ #!html <h1 style="color: grey">This is raw HTML</h1> }}}</pre>	This is raw HTML
Example 2: Highlighted Python code in a <code><div></code> block with custom style	
<pre>{ {{#!div style="background: #ffd; border: 3px ridge"}}</pre>	This is an example of embedded "code"

```

This is an example of embedded "code" block:

{{{
#!python
def hello():
    return "world"
}}}

}}}

```

block:

Example 3: Searching tickets from a wiki page, by keywords.

```

{{{
#!html
<form action="/query" method="get"><div>
<input type="text" name="keywords" value="~" size="30"/>
<input type="submit" value="Search by Keywords"/>
<!-- To control what fields show up use hidden fields
<input type="hidden" name="col" value="id"/>
<input type="hidden" name="col" value="summary"/>
<input type="hidden" name="col" value="status"/>
<input type="hidden" name="col" value="milestone"/>
<input type="hidden" name="col" value="version"/>
<input type="hidden" name="col" value="owner"/>
<input type="hidden" name="col" value="priority"/>
<input type="hidden" name="col" value="component"/>
-->
</div></form>
}}}

```

Available Processors

The following processors are included in the Trac distribution:

#!default	Present the text verbatim in a preformatted text block. This is the same as specifying <i>no</i> processor name (and no #!)
#!comment	Do not process the text in this section (i.e. contents exist only in the plain text - not in the rendered page).

HTML related

#!html	Insert custom HTML in a wiki page.
#!htmlcomment	Insert an HTML comment in a wiki page (<i>since 0.12</i>).
	Note that #!html blocks have to be <i>self-contained</i> , i.e. you can't start an HTML element in one block and close it later in a second block. Use the following processors for achieving a similar effect.
#!div	Wrap an arbitrary Wiki content inside a <div> element (<i>since 0.11</i>).
#!span	Wrap an arbitrary Wiki content inside a element (<i>since 0.11</i>).
#!td	Wrap an arbitrary Wiki content inside a <td> element (<i>since 0.12</i>)
#!th	Wrap an arbitrary Wiki content inside a <th> element (<i>since 0.12</i>)
#!tr	Can optionally be used for wrapping #!td and #!th blocks, either for specifying row attributes of better visual grouping (<i>since 0.12</i>)
	See WikiHtml for example usage and more details about these processors.

Other Markups

#!rst	Trac support for Restructured Text. See WikiRestructuredText .
#!textile	Supported if ?Textile is installed. See ?a Textile reference .
Code Highlighting Support	
#!c #!cpp (C++) #!python #!perl #!ruby #!php #!asp #!java #!js (Javascript) #!sql #!xml (XML or HTML) #!sh (Bourne/Bash shell) etc.	<p>Trac includes processors to provide inline syntax highlighting for source code in various languages.</p> <p>Trac relies on external software packages for syntax coloring, like ?Pygments. See TracSyntaxColoring for information about which languages are supported and how to enable support for more languages.</p>

Using the MIME type as processor, it is possible to syntax-highlight the same languages that are supported when browsing source code.

MIME Type Processors	
Some examples:	<p>The result will be syntax highlighted HTML code:</p> <pre>text</pre>

The same is valid for all other [mime types supported](#).

```

{{{
#!diff
--- Version 55
+++ Version 56
@@ -115,8 +115,9 @@
    name='TracHelloWorld', version='1.0',
    packages=find_packages(exclude=['*.tests']),
-   entry_points = """
-       [trac.plugins]
-       helloworld = myplugs.helloworld
-       """,
+   entry_points = {
+       'trac.plugins': [
+           'helloworld = myplugs.helloworld',
+       ],
+   },
}}}

```

#!diff has a particularly nice renderer:

• Version

```
115 115     name='TracHelloWorld', version='1.0',
116 116     packages=find_packages(exclude=['*.tests*']),
117     entry_points = """
118         [trac.plugins]
119             helloworld = myplugs.helloworld
120             """,
117     entry_points = {
118         'trac.plugins': [
119             'helloworld = myplugs.helloworld',
120         ],
121     },
121 122 )
```

Developing processors is no different from Wiki macros. In fact they work the same way, only the usage syntax differs. See [WikiMacros#DevelopingCustomMacros](#) for more information.
