

CamelCase

New words created by concatenating capitalized words.

CamelCase is the original wiki convention for creating hyperlinks, with the additional requirement that the capitals are followed by a lower-case letter; hence `?AlabamA?` and `?ABc?` will not be links.

Customizing the Wiki behavior

Some people dislike linking by CamelCase. While Trac remains faithful to the original Wiki style, it provides a number of ways to accomodate users with different preferences:

- To ignore links to missing pages when the link is written using the CamelCase style, that word can instead be replaced by a gray link followed by a question mark. This is useful in cases when CamelCase style is used to name code artifacts like class names and there's no corresponding page for them. This option can be set in `ignore_missing_pages` in the `[wiki]` section of TracIni.
- There's an option (`split_page_names` in the `[wiki]` section of TracIni) to automatically insert space characters between the words of a CamelCase link when rendering the link.
- Creation of explicit Wiki links is also easy, see WikiPageNames for details.
- Wiki formatting can be disabled completely in some places, for example when rendering commit log messages. See `wiki_format_messages` in the `[changeset]` section of TracIni.

See TracIni for more information on the available options.
